

2. Bookstack infra with Google auth, on default VPC

2. Bookstack infra with Google auth, on default VPC, RDS AutoBackup Off, Single-AZ, EC2. ≈\$51.40

Balanced BookStack deployment utilizing an **existing VPC** with **AWS Cognito** for **authentication**. **RDS Single-AZ** with **AutoBackup disabled** ensures **cost efficiency**, while **EFS Backup**, **Secrets Manager**, **Systems Manager**, **EC2**, and **CloudWatch Logs** provide security and monitoring.

You can always update the current stack using a **Change Set** to enable:

- **RDS Multi-AZ** (`MultiAZ=true`) for high availability,
- **RDS AutoBackup** (`AutoBackup=true`) for automatic backups,
- **RDS Deletion Protection** (`DeletionProtection=true`) to prevent accidental deletion.

However, **you cannot switch from the default VPC to a custom one** because the **CIDR block differs**, preventing the stack from being updated.

For instructions on updating the stack using a **Change Set**, please refer to the [dedicated guide](#).
